The Top 3 Risks of Managing Your Cannabis Operation using QuickBooks and Spreadsheets

1 Isolated Data Impacts Quick Decision Making

Whether it's sales, production management, purchasing, or inventory, each spreadsheet contains isolated data, without integration to the next. This limits access to real-time data. With data existing in multiple spreadsheets, sometimes emails, it becomes a challenge for the team to make strategic business decisions quickly.

2 No Single Source of Truth

If multiple spreadsheets are being shared across the team, data face-offs become a regular occurrence. Managing multiple systems and spreadsheets makes it hard for anyone in the business to truly have any real-time insight into products available to sell against incoming orders.

3 Loss of Valuable Business Time

Significant time is lost when it's spent consolidating, modifying, rekeying, and correcting data stored in different spreadsheets and systems.

With SilverLeaf, and Microsoft Dynamics Business Central, cannabis cultivators, processors, and distributors can have all their data in one centralized database. This makes it easier to keep the information accurate and up to date. And with Dynamics 365 Business Central running in the cloud, you can make that data accessible to everyone in the business in real time—anywhere they're working—the the grow areas, production facility, back office, home, or while visiting customers and vendors.
