The Four Keys to

Profitable Inventory Management with SilverLeaf

Optimize Inventory

Cannabis growers and producers require realtime visibility of inventory on hand by location and strain. With SilverLeaf's inventory availability matrix, you can easily see what's available based on product line, strain, and location over time. You can also track quantities available for specific customers or locations, along with allocated sales orders and upcoming production orders.

Monitor Waste Destruction

Track the source of cannabis material up to the destruction point and eliminate manual tasks. SilverLeaf eliminates manual data tracking by automatically producing documentation that references the origin of where destroyed material came from.

Increase Production

Managing cannabis production involves more than just determining plant quantities. With SilverLeaf, you record and analyze plant production orders, track cultivation capacity, and view strain, location, and seasonal production data. By comparing this nformation to sales forecasts, you make informed decisions about purchasing or growing, set production schedules, and allocate necessary resources.

Streamline Key Quality Testing

Streamline testing and record-keeping to minimize delays as much as possible. SilverLeaf simplifies this process by assigning required testing to each item, capturing vital information and tracking state-required data for certificates of analysis. Inventory that has not passed testing will be guarantined so it is not used in production or sold.

SilverLeaf offers solutions to optimize inventory, track waste destruction, increase production efficiency, and streamline quality testing. With accurate data tracking, you can make informed decisions, evaluate processes, and anticipate future needs, ultimately maximizing profitability.
